### 16S Metagenomic Analysis Tutorial - Max Planck Society

Although this tutorial focusses on 16S, this pipeline can be applied to any other metagenomic marker, such as 18S, ITS, CO1, provided a suitably curated database for BLAST searching is available. The final exercise in the tutorial uses the 16S Biodiversity tool to classify the processed amplicon reads.

There are a variety of bioinformatic pipelines and downstream analysis methods for analyzing 16S rRNA marker-gene surveys. However, appropriate assessment datasets and metrics are needed as there is limited guidance to decide between available analysis methods. Mixtures of environmental samples are useful for assessing analysis methods as one can evaluate methods based on calculated expected ...

It allows the extraction of rRNA data from shotgun metagenomic data using tools such as rRNASelector 110 for concurrent marker metagenomic analysis. It therefore supports additional 16S rRNA-based analysis tools such as Qiime 111 (see section on Marker Gene Metagenomics) for the efficient taxonomic assignment of these sequences. For functional ...

Shotgun metagenomic sequencing does not depend on gene-targeted primers or PCR amplification; thus, it is not affected by primer bias or chimeras. However, searching rRNA genes from large shotgun Illumina data sets is computationally expensive, and no approach exists for unsupervised community analysis of small-subunit (SSU) rRNA gene fragments retrieved from shotgun data.

High-throughput sequencing of DNA from environmental samples is a powerful tool for investigating microbial and non-microbial communities. Community composition can be characterized by sequencing taxonomically informative marker genes, such as the 16S rRNA gene in bacteria [1,2,3,4]. Shotgun metagenomics, in which all DNA recovered from a sample is sequenced, can also characterize functional ...
